- In the previous lecture, we learned that for a set  $\mathcal{P}$  of points  $p_k$ ,  $k \in [1, n]$ , in the scene region, the intensities  $I(p_k)$  must be obtained by **interpolation**.

# Planar cuts, reslicing, and interpolation

- In the previous lecture, we learned that for a set  $\mathcal{P}$  of points  $p_k$ ,  $k \in [1, n]$ , in the scene region, the intensities  $I(p_k)$  must be obtained by **interpolation**.
- Today, we will learn how to create sequences of cuts (new slices) in the scene for a given viewing direction and orientation  $\mathbf{n}'$ , which also requires interpolation.

# Planar cuts, reslicing, and interpolation

- In the previous lecture, we learned that for a set  $\mathcal{P}$  of points  $p_k$ ,  $k \in [1, n]$ , in the scene region, the intensities  $I(p_k)$  must be obtained by **interpolation**.
- Today, we will learn how to create sequences of cuts (new slices) in the scene for a given viewing direction and orientation  $\mathbf{n}'$ , which also requires interpolation.
- We will then learn how to estimate the intensity at any point inside the scene region from the intensities of the nearby spels — i.e., the interpolation operation.

# Planar cuts and reslicing

In order to obtain a planar cut (slice) at a point  $p_0$  inside the scene, such that  $\mathbf{n}'$  is the orthogonal vector to the cut, one needs to apply the following transformations:

- Translate the viewing (**cut**) plane (i.e., center of  $\hat{J}$ ) to the origin of the  $(x, y, z)$  coordinate system.
- Align the  $\mathbf{n}$  vector to the desired viewing vector  $\mathbf{n}'$  — this is the inverse of the transformation that aligns an arbitrary vector to the z-axis.
- Translate the rotated viewing plane to the desired location  $p_0$ .

# Planar cuts and reslicing

In order to obtain a planar cut (slice) at a point  $p_0$  inside the scene, such that  $\mathbf{n}'$  is the orthogonal vector to the cut, one needs to apply the following transformations:

- Translate the viewing (cut) plane (i.e., center of  $\hat{J}$ ) to the origin of the  $(x, y, z)$  coordinate system.
- Align the  $\mathbf{n}$  vector to the desired viewing vector  $\mathbf{n}'$  — this is the inverse of the transformation that aligns an arbitrary vector to the z-axis.
- Translate the rotated viewing plane to the desired location  $p_0$ .

# Planar cuts and reslicing

In order to obtain a planar cut (slice) at a point  $p_0$  inside the scene, such that  $\mathbf{n}'$  is the orthogonal vector to the cut, one needs to apply the following transformations:

- Translate the viewing (cut) plane (i.e., center of  $\hat{J}$ ) to the origin of the  $(x, y, z)$  coordinate system.
- Align the  $\mathbf{n}$  vector to the desired viewing vector  $\mathbf{n}'$  — this is the inverse of the transformation that aligns an arbitrary vector to the z-axis.
- Translate the rotated viewing plane to the desired location  $p_0$ .

# Planar cuts and reslicing

In order to obtain a planar cut (slice) at a point  $p_0$  inside the scene, such that  $\mathbf{n}'$  is the orthogonal vector to the cut, one needs to apply the following transformations:

- Translate the viewing (**cut**) plane (i.e., center of  $\hat{J}$ ) to the origin of the  $(x, y, z)$  coordinate system.
- Align the  $\mathbf{n}$  vector to the desired viewing vector  $\mathbf{n}'$  — this is the inverse of the transformation that aligns an arbitrary vector to the z-axis.
- Translate the rotated viewing plane to the desired location  $p_0$ .

# Planar cuts and reslicing

Therefore, for every  $p \in D_J$ , we must apply the transformation  $\Psi$  below, being  $\Psi_r = \mathbf{R}_x(-\alpha)\mathbf{R}_y(\beta)$  the alignment of  $\mathbf{n}$  with  $\mathbf{n}'$ :

$$\begin{bmatrix} x_{p'} \\ y_{p'} \\ z_{p'} \\ 1 \end{bmatrix} = \mathbf{T}(+x_{p_0}, +y_{p_0}, +z_{p_0})\Psi_r\mathbf{T}\left(\frac{-d}{2}, \frac{-d}{2}, \frac{d}{2}\right) \begin{bmatrix} u_p \\ v_p \\ \frac{-d}{2} \\ 1 \end{bmatrix}$$

- The coordinates  $p' = (x_{p'}, y_{p'}, z_{p'})$  may not be integers, which requires interpolation to assign  $J(p) \leftarrow I(p')$ .
- For reslicing a scene from  $p_0$  with spacem  $\lambda > 0$  between slices, one can move the cut plane to  $p_k = p_{k-1} + \lambda\mathbf{n}'$ ,  $k = 1, 2, \dots, n - 1$ .

# Algorithm to get a slice given $p_0$ and $\mathbf{n}'$

Input: Scene  $\hat{I} = (D_I, I)$ ,  $p_0$ , and  $\mathbf{n}'$ .

Output: Image  $\hat{J} = (D_J, J)$  of the slice.

- 1 Compute  $\Psi$  and  $\Psi_r$  from  $p_0$ ,  $\mathbf{n} = (0, 0, 1, 0)$ , and  $\mathbf{n}'$ .
- 2 For each  $p \in D_J$  do
- 3      $p' \leftarrow \Psi(p)$ .
- 4     If  $(\lceil x_{p'} \rceil, \lceil y_{p'} \rceil, \lceil z_{p'} \rceil) \in D_I$  then
- 5          $J(p) \leftarrow I(p')$  using interpolation.

# Reslicing algorithm

Input: Scene  $\hat{I} = (D_I, I)$ ,  $p_0$ ,  $\mathbf{n}'$ ,  $\lambda$ , and number  $n$  of slices.

Output: Scene  $\hat{J} = (D_J, J)$ , with axial slices  $J_0, J_1, \dots, J_{n-1}$ .

- 1  $J_0 \leftarrow \text{GetSlice}(\hat{I}, p_0, \mathbf{n}')$ .
- 2 For  $k = 1$  to  $n - 1$  do
- 3      $p_k \leftarrow p_{k-1} + \lambda \mathbf{n}'$ .
- 4      $J_k \leftarrow \text{GetSlice}(\hat{I}, p_k, \mathbf{n}')$

# Interpolation

- Interpolation estimates the intensity  $I(p')$  at a point  $p' = (x_{p'}, y_{p'}, z_{p'})$  with real coordinates inside a scene by using the spel values  $I(q_k)$ ,  $k = 1, 2, \dots, |\mathcal{A}(p')|$ , where  $q_k \in \mathcal{A}(p') \subset D_I$  and  $\mathcal{A}(p')$  is a set of nearby spels of  $p'$ .
- Interpolation is required when geometric transformations  $\Phi$  on spels of an image  $\hat{I} = (D_I, I)$  create an image  $\hat{J} = (D_J, J)$ .
- In order to avoid **holes** (i.e., unfilled spels in  $\hat{J}$ ), one must apply  $\Phi^{-1}$  on each spel  $p \in D_J$  to obtain  $p' = \Phi^{-1}(p)$ , with real coordinates for interpolation  $J(p) \leftarrow I(p')$ .

# Interpolation

- Interpolation estimates the intensity  $I(p')$  at a point  $p' = (x_{p'}, y_{p'}, z_{p'})$  with real coordinates inside a scene by using the spel values  $I(q_k)$ ,  $k = 1, 2, \dots, |\mathcal{A}(p')|$ , where  $q_k \in \mathcal{A}(p') \subset D_I$  and  $\mathcal{A}(p')$  is a set of nearby spels of  $p'$ .
- Interpolation is required when geometric transformations  $\Phi$  on spels of an image  $\hat{I} = (D_I, I)$  create an image  $\hat{J} = (D_J, J)$ .
- In order to avoid **holes** (i.e., unfilled spels in  $\hat{J}$ ), one must apply  $\Phi^{-1}$  on each spel  $p \in D_J$  to obtain  $p' = \Phi^{-1}(p)$ , with real coordinates for interpolation  $J(p) \leftarrow I(p')$ .

# Bilinear interpolation

In 2D, the nearby spels  $q_k \in \mathcal{A}(p') \subset D_I$ ,  $k = 1, 2, 3, 4$ , may be obtained as  $q_1 = (\lfloor x_{p'} \rfloor, \lfloor y_{p'} \rfloor)$ ,  $q_2 = (\lfloor x_{p'} \rfloor + 1, \lfloor y_{p'} \rfloor)$ ,  $q_3 = (\lfloor x_{p'} \rfloor, \lfloor y_{p'} \rfloor + 1)$ , and  $q_4 = (\lfloor x_{p'} \rfloor + 1, \lfloor y_{p'} \rfloor + 1)$ .

$$\begin{aligned} I(p') &= (y_{p'} - y_{q_{12}})I(q_{34}) + (y_{q_{34}} - y_{p'})I(q_{12}) \\ I(q_{12}) &= (x_{p'} - x_{q_1})I(q_2) + (x_{q_2} - x_{p'})I(q_1) \\ I(q_{34}) &= (x_{p'} - x_{q_3})I(q_4) + (x_{q_4} - x_{p'})I(q_3) \end{aligned}$$

# Bilinear interpolation

Scaling and rotation around the center of the image and axis z.

# Trilinear interpolation

In 3D, the nearby spels  $q_k \in \mathcal{A}(p') \subset D_I$ ,  $k = 1, 2, \dots, 8$ , are obtained similarly, based on the floor operations on the  $x_{p'}$ ,  $y_{p'}$ , and  $z_{p'}$  real coordinates of  $p'$ .

$$I(p') = (x_{p'} - x_{q_{1357}})I(q_{2468}) + (x_{q_{2468}} - x_{p'})I(q_{1357})$$

$$I(q_{2468}) = (z_{p'} - z_{q_{24}})I(q_{68}) + (z_{q_{68}} - z_{p'})I(q_{24})$$

$$I(q_{1357}) = (z_{p'} - z_{q_{13}})I(q_{57}) + (z_{q_{57}} - z_{p'})I(q_{13})$$

# Trilinear interpolation

$$I(q_{24}) = (y_{p'} - y_{q_4})I(q_2) + (y_{q_2} - y_{p'})I(q_4)$$

$$I(q_{68}) = (y_{p'} - y_{q_8})I(q_6) + (y_{q_6} - y_{p'})I(q_8)$$

$$I(q_{13}) = (y_{p'} - y_{q_3})I(q_1) + (y_{q_1} - y_{p'})I(q_3)$$

$$I(q_{57}) = (y_{p'} - y_{q_7})I(q_5) + (y_{q_5} - y_{p'})I(q_7)$$

# Reformatting a scene

Therefore, a scene  $\hat{I} = (D_I, I)$  with spels sizes  $(d_x, d_y, d_z)$  can be **reformatted** into a scene  $\hat{J} = (D_J, J)$  with spels sizes  $(d'_x, d'_y, d'_z)$  by scaling  $D_J$ , with factors  $s_x = \frac{d_x}{d'_x}$ ,  $s_y = \frac{d_y}{d'_y}$ , and  $s_z = \frac{d_z}{d'_z}$ , and determining the intensities  $J(p)$  via 3D interpolation in  $\hat{I} = (D_I, I)$ .

## Reformatting a scene

Therefore, a scene  $\hat{I} = (D_I, I)$  with spels sizes  $(d_x, d_y, d_z)$  can be **reformatted** into a scene  $\hat{J} = (D_J, J)$  with spels sizes  $(d'_x, d'_y, d'_z)$  by scaling  $D_J$ , with factors  $s_x = \frac{d_x}{d'_x}$ ,  $s_y = \frac{d_y}{d'_y}$ , and  $s_z = \frac{d_z}{d'_z}$ , and determining the intensities  $J(p)$  via 3D interpolation in  $\hat{I} = (D_I, I)$ . However, it is more efficient to

- interpolate  $\hat{I} = (D_I, I)$  along  $x$ , generating  $\hat{I}' = (D_{I'}, I')$  with spels sizes  $(d'_x, d_y, d_z)$ ,
- then interpolate  $\hat{I}' = (D_{I'}, I')$  along  $y$ , generating  $\hat{I}'' = (D_{I''}, I'')$  with spels sizes  $(d'_x, d'_y, d_z)$ , and
- finally interpolate  $\hat{I}'' = (D_{I''}, I'')$  along  $z$ , generating  $\hat{J} = (D_J, J)$  with spels sizes  $(d'_x, d'_y, d'_z)$ .

# Reformatting a scene

- For instance, let  $q_1, q_2, \dots, q_{n_x}$  be the voxels along the  $x$  direction of  $\hat{I} = (D_I, I)$  for a fixed row  $y$  and a fixed slice  $z$ .
- By starting at  $p_1 = q_1 = (x_{q_1}, y, z) \in D_I$  and adding  $d'_x$  to generate the subsequent voxels  $p_{k+1} = (x_{p_1} + kd'_x, y, z) \in D_{I'}$ ,  $k = 1, 2, \dots, n'_x - 1$ , the intensities  $I'(p_{k+1})$  of the subsequent voxels  $p_{k+1} \in D_{I'}$  can be found by linear interpolation.

$$I'(p_{k+1}) = (x_{p_{k+1}} - x_{q_k})I(q_{k+1}) + (x_{q_{k+1}} - x_{p_{k+1}})I(q_k).$$

# Effects of reformatting

A scene should be reformatted to become **isotropic** — i.e., with spels of equal sizes in all axes. This is paramount for rendering and segmentation.

Axial slices from bottom to top:  $d'_x = d'_y < d'_z$  (left),  $d'_x = d'_y > d'_z$  (center), and  $d'_x = d'_y = d'_z$  (right, isotropic).
