 - Connected curve because it can be represented by a sequence (path) of 8-adjacent pixels (arcs).
 - Oriented curve because when it is followed in clockwise orientation, its interior stays on the right side of the curve.
- Each contour encodes important shape properties for object description.

• Challenges in contour extraction and labeling.

• Algorithm for contour extraction and labeling.

• Geodesic length of a contour.

-

Challenges in contour extraction and labeling

Noise in binary images might create (A) an open curve, (B) a contour with branches, and (C) a contour with bottleneck pixels. (D) Two contours might touch each other and (E) a contour might touch its opposite side.

Challenges for contour pixel labeling

• A morphological dilation of the object in the binary image $\hat{l} = (D_I, I)$ can reduce some of these problems.

・ 戸 ト ・ ヨ ト ・ ヨ ト

Challenges for contour pixel labeling

- A morphological dilation of the object in the binary image $\hat{l} = (D_I, I)$ can reduce some of these problems.
- The dilation creates an image $\hat{J} = (D_I, J)$ such that

$$J(p) = \max_{q \in \mathcal{A}_r(p)} \{I(q)\},$$

where \mathcal{A}_r is from now on defined as

$$\mathcal{A}_r$$
 : { $(p,q) \in D_I \times D_I \mid ||q-p|| \leq r$ }.

Challenges for contour pixel labeling

- A morphological dilation of the object in the binary image $\hat{l} = (D_I, I)$ can reduce some of these problems.
- The dilation creates an image $\hat{J} = (D_I, J)$ such that

$$J(p) = \max_{q \in \mathcal{A}_r(p)} \{I(q)\},$$

where \mathcal{A}_r is from now on defined as

$$\mathcal{A}_r$$
 : { $(p,q) \in D_I \times D_I \mid ||q-p|| \leq r$ }.

 In any case, the algorithm must eliminate open curves, branches, ears at bottleneck pixels, and assign labels to pixels of touching contours and of contours that touches their opposite side.

• For a given binary image $\hat{l} = (D_l, l)$, the algorithm must be constrained to the border set \mathcal{B} .

$$\mathcal{B} \quad : \quad \{p \in D_I \mid I(p) = 1 \text{ and } \exists q \in \mathcal{A}_1(p) \mid I(q) = 0\}.$$

$$\mathcal{B} \quad : \quad \{p \in D_I \mid I(p) = 1 \text{ and } \exists q \in \mathcal{A}_1(p) \mid I(q) = 0\}.$$

• For each contour, the algorithm must return a path $\pi_{p_1 \to p_n}$, wherein $(p_i, p_{i+1}) \in \mathcal{A}_{\sqrt{2}}$, i = 1, 2, ..., n-1, being *n* the size of the contour.

• For a given binary image $\hat{I} = (D_I, I)$, the algorithm must be constrained to the border set \mathcal{B} .

$$\mathcal{B}$$
 : { $p \in D_I \mid I(p) = 1$ and $\exists q \in \mathcal{A}_1(p) \mid I(q) = 0$ }.

- For each contour, the algorithm must return a path $\pi_{p_1 \to p_n}$, wherein $(p_i, p_{i+1}) \in \mathcal{A}_{\sqrt{2}}$, i = 1, 2, ..., n-1, being *n* the size of the contour.
- It must also avoid arcs ⟨p, q⟩ which pass through the object/background and take into account the anti-clockwise orientation (i.e., *I*(*le*(p, q)) = 1 and *I*(*ri*(p, q)) = 0).

It starts from pixels that define valid arcs and visits the border pixels in depth search using clockwise adjacency relation $\mathcal{A}_{\sqrt{2}}$.

Silly contour with a last invalid arc at the top. Labels should not be assigned when (a) the path starts but never finishes and (b) it finishes as a silly contour. (c)-(d) A valid contour and its pixel labels.

 Therefore, once a pixel p has the starting pixel q as its neighbor and P(p) ≠ q, the contour is about to close.

- Therefore, once a pixel p has the starting pixel q as its neighbor and $P(p) \neq q$, the contour is about to close.
- At this moment, if it is not a silly contour, we can start the labeling process.

イロト イポト イヨト イヨト

- Therefore, once a pixel p has the starting pixel q as its neighbor and $P(p) \neq q$, the contour is about to close.
- At this moment, if it is not a silly contour, we can start the labeling process.
- A silly contour is detected when P(P(p)) is the starting pixel.

イロト イポト イヨト イヨト

- Therefore, once a pixel p has the starting pixel q as its neighbor and $P(p) \neq q$, the contour is about to close.
- At this moment, if it is not a silly contour, we can start the labeling process.
- A silly contour is detected when P(P(p)) is the starting pixel.
- Therefore, the algorithm visits pixels in \mathcal{B} in anti-clockwise until the starting pixel is reached again. If the path is not a silly contour, its pixels are labeled clockwise using P.
